

Frontend Structure

Introduction

The **frontend** of the House Rent Management System is developed using **React.js** and **Vite**. It provides a responsive, user-friendly interface for **Renters, Owners, and Admins**. The frontend communicates with the backend through REST APIs using **Axios**, while **React Router** handles navigation between different pages. User authentication, theme management, and role management are handled using the **Context API**.

Frontend Architecture

React Application Architecture

React: The Component-Based UI

Building User Interfaces, One Piece at a Time

The UI is a function of your State

Main Frontend Modules

1. Common Module

Contains pages that are accessible to all users.

- Home
- Login
- Register
- Property Details
- Search Results
- Forgot Password
- Reset Password
- Navbar
- Footer

2. User (Tenant) Module

Provides features for renters.

- User Dashboard
- Wishlist
- Booking History
- My Profile
- Browse Properties

3. Owner Module

Provides features for property owners.

- Owner Dashboard
- Add Property
- Manage Properties
- Booking Requests
- Property Form

4. Admin Module

Provides administrative features.

- Admin Dashboard
- User Management
- Property Approval
- Booking Management
- Analytics

Frontend Technologies

Technology	Purpose
React.js	Builds the user interface
Vite	Fast frontend development and build tool
React Router	Navigation between pages
Axios	API communication with the backend
Context API	Authentication, Theme, and Role management
CSS	Responsive user interface

This matches the technologies and structure described in the implementation plan.

Frontend Request Flow
