

# House Rent Management System – Customer Journey & Implementation

## Overview

**Project:** House Rent Management System

Technology Stack: React, Vite, Node.js, Express.js, MongoDB, JWT Authentication

## Customer Journey

| Stage           | User Action                 | System Response                         | Goal                  | Improvement            |
|-----------------|-----------------------------|-----------------------------------------|-----------------------|------------------------|
| Discover        | Browse properties           | Displays approved listings with filters | Find suitable house   | AI recommendations     |
| Register/Login  | Create account              | JWT authentication                      | Secure access         | Social login           |
| Search          | Filter by city, price, type | Fast search results                     | Find matching rentals | Advanced filters       |
| View Property   | Open property details       | Images, amenities, reviews              | Evaluate property     | Virtual tour           |
| Book Visit      | Select date/time            | Booking request sent to landlord        | Schedule visit        | Real-time availability |
| Landlord Review | Approve/Reject              | Status updated                          | Manage bookings       | Instant notifications  |
| Complete        | Tenant visits property      | Booking history saved                   | Track activities      | Feedback reminders     |
| Review          | Submit rating               | Review stored                           | Help others           | Review analytics       |

## Implementation Summary :

- Three user roles: Tenant, Landlord, Admin.
- Tenants browse, wishlist, book visits, and review properties.
- Landlords add/manage properties, upload images, and approve bookings.
- Admin manages users, property approvals, and analytics.
- MongoDB stores users, properties, bookings, reviews, and wishlists.
- JWT secures authentication and role-based authorization.
