

Features

1. Presentation Layer (Frontend)

Description:

The Presentation Layer is developed using React.js and provides a responsive, interactive, and user-friendly interface. It supports desktops, tablets, and mobile devices with features such as dark mode and role-specific dashboards for Users, Landlords, and Admins.

2. Authentication Module

Description:

The Authentication Module provides secure user access through registration, login, JWT-based authentication, password reset, and role-based authorization. It

ensures only authorized users can access system resources according to their roles.

3. Property Search Module

Description:

This module enables users to search properties using advanced filters such as location, property type, budget, number of bedrooms, bathrooms, property size, and amenities. Users can also save their search preferences for future use.

4. Property Management Module

Description:

The Property Management Module allows landlords to create, update, delete, and manage property listings. It also supports property image uploads and listing status management.

5. Property Approval Module

Description:

This module enables administrators to verify, approve, or reject property listings before they are published on the platform, ensuring quality and authenticity.

6. Wishlist Module

Description:

Users can save their preferred properties in a wishlist, making it easier to compare and revisit favorite listings later.

7. Booking Module

Description:

The Booking Module allows users to schedule property visits, track booking status, and maintain booking history. Landlords can manage and respond to booking requests efficiently.

8. Market Insights Module

Description:

This module provides valuable real estate information, including property price trends, neighborhood facilities, transport options, schools, crime rates, and investment potential, helping users make informed decisions.

9. Review and Rating Module

Description:

Users can submit reviews and ratings for properties they have visited or rented. This feature increases transparency and helps future buyers or tenants evaluate listings.

10. Dashboard Module

Description:

Separate dashboards are provided for Users, Landlords, and Administrators. Each dashboard displays role-specific information such as bookings, property listings, analytics, tenant requests, and platform management.

11. Analytics Module

Description:

The Analytics Module provides real-time statistics, including property views, booking counts, listing performance, and overall platform analytics to help administrators and landlords monitor system performance.

12. Profile Management Module

Description:

Users can manage their personal information, update profile details, change passwords, and maintain account settings securely through the profile management interface.

13. Backend API Layer

Description:

The Backend API Layer is built using Express.js and follows RESTful architecture principles. It handles authentication, business logic, property operations, bookings, reviews, dashboards, and communication with the database.

14. Database Layer

Description:

The application uses MongoDB as its NoSQL database and Mongoose as the Object Data Modeling (ODM) library. It stores user information, property listings, bookings, wishlists, reviews, and other application data efficiently.

15. Architecture Pattern

Description:

The application follows the MERN Stack architecture (MongoDB, Express.js, React.js, Node.js) using the MVC (Model-View-Controller) design pattern, ensuring modularity, scalability, maintainability, and clean code organization.

16. Security Layer

Description:

The Security Layer protects the application using JWT authentication, password hashing, authorization middleware, secure REST APIs, and role-based permissions to ensure data privacy and secure access.

Workflow
