

Project Development Phase Model Performance Test

Date	05 July 2026
Team ID	
Project Name	House Rent
Maximum Marks	

Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1.	Model Summary	The House Rent Management System is a full-stack web application developed using React.js (Vite), Node.js, Express.js, and MongoDB. It provides secure authentication, property management, property search and filtering, booking management, wishlist functionality, reviews, and an admin dashboard. The system uses REST APIs and MongoDB for efficient data storage and retrieval.	
2.	Accuracy	Not Applicable (N/A) – This project is not based on Machine Learning or Deep Learning; therefore, Training Accuracy and Validation Accuracy are not applicable. System functionality was verified through successful execution of all modules, including authentication, CRUD operations, booking, and data retrieval.	The Saved Wishlist allows users to view and manage their favorite properties in one place. Each listing displays essential details such as the property image, type, rental price, and location, enabling users to quickly access and compare their preferred properties for future booking decisions. 
3.	Fine Tuning Result(if Done)	Not Applicable (N/A) – Fine tuning is applicable only to AI/ML models. Performance optimization in this project was achieved through database indexing, API optimization, input validation, and efficient React component rendering.	 The HouseHunt Role Selection Page is the first screen displayed to users, allowing them to choose between User, Landlord, and Admin roles. Each role provides a brief overview of its functionalities and a "Continue" button for role-specific login and dashboard access, ensuring a secure and personalized user experience.
